1 Welcome

hitlijsten.hhaken.nl is a searchable archive of Dutch music charts: **539.163 chart entries** from **21 charts**, from the very first Top 40 of 1965 to last Friday's chart. The site is free, has no accounts and shows no advertising.

There are two kinds of charts. The **four weekly charts** — Dutch Top 40, Tipparade, Oranje Top 30 and Sterren NL Top 25 — are updated automatically every Friday evening. Alongside them the archive holds **17 annual charts**, from the Top 2000 to the Zomer Top 500: charts that Dutch radio stations broadcast once a year.

The menu bar

Every page has two menu rows. The **top row** holds the chart views: Overview, Weekly charts, Year charts, Decades, Top 40 all-time and Annual all-time. The **second row** holds the specials: Search, Your day, Week report, Fun facts, Records, Versions, Compare, DJ Export, the Guestbook and — at the very end — a die that opens a random song from the archive. At the top right, the NL/EN button switches between Dutch and English.

TIP

The whole site is bilingual: the chart pages, the special pages and this manual all follow the NL/EN switch. Only the admin area is Dutch-only.

2 The chart pages

Overview

The front page shows the key figures of the archive, the most recent weekly charts and a look-back block: which songs were number 1 on this day 10, 25 or 40 years ago?

Weekly charts

Pick a chart, a year and a week and you see the chart as it aired, with the broadcast date: position, previous position, artist, title and weeks on chart. New entries and returning songs get a coloured badge, and the < previous and next > buttons page through the calendar week by week — across the year boundary too.

Year charts

For every chart and year the site builds a **points ranking** from all weekly entries of that year: the higher and the longer a song charted, the more points. One table shows what really mattered that year — including peak position, weeks on chart and the run from first to last entry. For the annual charts (Top 2000 and the like) every **edition** is shown exactly as broadcast. Here too the < previous and next > buttons page through the years, and on the Decades page through the decades. In the chart picker the annual charts are grouped by station, from Arrow to Veronica.

Decades and Top 40 all-time

The same points ranking, but across ten years (the sixties up to now) or across the **complete Top 40 history** since 1965 in one list.

Annual all-time

All 17 annual charts merged into one ranking. Because 15th place in a Top 500 is worth something different than 15th place in a Top 2000, positions are **normalised** to the length of the chart; after that everything adds up fairly. The Top 40 numbers deliberately stay out of this list: weekly and annual charts measure different things.

3 Choosing, filtering and downloading

On every chart page you decide what is on the screen — and everything you download follows that choice exactly.

- **Show:** by default you see the top 100; the picker also offers 500, 1000, 2500 or the complete chart — only the choices that fit the chart's length. Short charts (up to 250 songs) simply show everything.
- **Dutch-language only:** the checkbox with the little flag limits the chart to (presumably) Dutch-language songs.
- **New entries only:** shows only songs that entered this chart for the first time in the chosen year. On a weekly chart the checkbox means that wéék's new entries — exactly the rows with the green badge.

Below every chart are download buttons for **Excel** and **PDF** (and, with a DJ database loaded, **DJ Export** — see chapter 6). The download contains exactly the selection on your screen; the file name says so, with a suffix like _top100, _NL or _nieuw.

TIP

The PDFs are made for printing: forty rows per page, calm black-on-white, only the header in colour. Handy for the studio or the record fair.

4 Searching and browsing

The search box

Search by artist, title or both. A few tricks:

- **artist | title** — a vertical bar searches precisely: artist left of the bar, title right of it. For example: abba | waterloo.
- **Wildcards**: an asterisk (*) means „anything goes”. Searching do*n finds both Down and Doorgaan.
- If nothing turns up, the site offers a clickable suggestion.

Song pages

Click a title and you land on that song's page: the complete chart run as a graph, every entry in every chart, and search buttons for YouTube and Spotify. If several versions of a title exist, they are listed too.

Artist pages

Click an artist name for that artist's complete chart history across all charts — over 13,000 artists have such a page.

What the symbols mean

SYMBOL	MEANING
NL flag	(Presumably) Dutch-language song; on the song page this can be corrected per song.
Bell	Alarmschijf: named record of the week by the Top 40.
„new” badge	New entry that week.
„back” badge	Re-entry: charted before, dropped out and returned.
< and >	In year charts: the run started before or continued after the year shown.

5 The special pages

Your day (Jouw dag)

Pick a date — your birthday, your wedding day — and see which chart was current that week, what was number 1 and what the whole chart looked like. Works for any date from 1965 on.

Week report (Weekbericht)

Every Friday evening, as soon as the new charts are in, the site writes a short report of its own: the new number 1, the highest new entry, the biggest climber and faller. To follow it automatically there is an **RSS feed** (weekbericht.rss) for your feed reader — the feed link on the page follows your language choice, so you subscribe to the English edition.

Records

The record books of the whole archive: most weeks on chart, longest run at number 1, biggest jump and deepest fall, longest re-entry gap, one-hit wonders that went straight to number 1, longest careers and more.

Versions (Versies)

Same title, different recording: this page groups title families so you can see who took a song into the charts — and whose version went highest.

Compare (Vergelijk)

Put two years side by side: number of songs, new entries, language split and the top songs of both years at a glance.

Fun facts (Wetenswaardigheden)

A collection of striking facts from the archive, per chart and refinable with the NL filter.

Surprise me (the die)

The die at the end of the menu bar opens a random song from the 539.163 entries — complete with its chart run. Every roll is different: from a forgotten 1971 Tipparade record to last month's hit. Fun to browse, and more addictive than you'd think.

Guestbook and feedback

Spotted something wrong, or just want to say hello? The bottom of every page links to the feedback form and the guestbook. Messages arrive privately first; the site owner publishes what belongs in the guestbook.

6 DJ Export: from chart to playlist

Do you DJ with VirtualDJ or rekordbox? Then the site can turn any chart in the archive into a **ready-made playlist from your own music library**. You load your database once; every chart page then gets a DJ Export button that matches the shown selection against what you own, and offers the result as a playlist file — plus a shopping list of what you are still missing.

Step 1 · make a backup in VirtualDJ

Open VirtualDJ and choose **Settings** → **Backup**. That produces a single zip with your complete database in it — including music on external drives that are not connected right now. That zip is exactly what the site needs. A bare database.xml works too (even several at once), but the backup zip is smaller and more complete. Running **rekordbox** instead? Export your collection there (File → Export collection in xml format) and upload that file — the site recognises it automatically.

TIP

An upload may be 256 MB at most. That is ample for any backup zip (usually a few tens of megabytes), but a bare database.xml can exceed it — one more reason to use the zip.

Step 2 · load it on the DJ Export page

Go to **DJ Export** in the menu bar, pick your zip and press „Load the database”. Three choices control what gets loaded:

- **Include streaming tracks:** besides local files VirtualDJ also knows streaming references (netsearch). By default they are left out; tick the box and a local file still beats a streaming version.
- **File type:** by default only audio (mp3, flac and the like) counts. Video files otherwise tend to win on file size — an mp4 in your playlist when you wanted audio. Playing video sets? Choose „video only” or „audio and video”.
- **Matching strictness:** how loosely the site may match your tags to the chart titles — see the table below.

LEVEL	HOW STRICT
very strict	Artist and title must match exactly (after normalising case, accents and „feat.” spellings).
strict	Also fine: differences in brackets — (Radio Edit), (Live) — and duet credits. If the chart says „Meat Loaf & Ellen Foley” and your tag says „Meat Loaf”, that is the same record. This is the default.
loose	The title must match; the artist name may roughly resemble it (typos, different order).
very loose	The title may be slightly off too. These matches are labelled „doubtful” in the report — do check them.

PRIVACY

Your database only lives in the server's working memory during your visit (four hours at most) and is **never stored on disk**. The „forget my database” button removes it immediately; loading again replaces the previous one.

Step 3 · press the DJ Export button

Once your database is loaded, a DJ Export button appears next to the Excel and PDF buttons on **every chart page** — weekly charts, year charts, editions, decades and both all-time lists. It takes exactly the selection on your screen: pick the top 100 with the NL filter on, and that becomes your playlist.

Step 4 · the report

You get a report page with four counters: how many songs were **found** in your library, how many are **missing** (your shopping list), how many are **doubtful** and how big your loaded library is. Below that, every chart row with its status and the file path found. If a song exists more than once in your library, the local file with the highest bitrate wins.

Step 5 · use it in your DJ software

The download button adapts to your source, and the file is named after the chart and your selection. If you loaded a **VirtualDJ** database you get a **.vdjfolder** file: put it in the **MyLists** folder inside your VirtualDJ folder (usually Documents\VirtualDJ\MyLists) and it appears there as a playlist, in chart order. If you loaded a **rekordbox** collection you get an **.m3u8** file: import it into rekordbox — or Engine DJ, Traktor, Serato and almost any media player. Want it on **Pioneer or Denon hardware** (CDJs, Prime players)? Import the M3U8 into rekordbox or Engine DJ respectively and let that export it to your USB stick — the players only read their own format.

TIP

If your music lives on an external drive, connect it before playing the playlist: the playlist file points at the file paths as they are in your database.

7 Privacy, sources and contact

Privacy

The site has no accounts, no advertising and no tracking cookies; there is only a functional session cookie (and a cookie remembering your language). A loaded DJ database lives exclusively in working memory and disappears by itself.

Sources

The weekly charts are compiled by top40.nl (Dutch Top 40, Tipparade, Sterren NL Top 25) and oranjetop30.nl; Alarmschijf markings via top40.nl. The annual charts are compiled by the radio stations and collected via datastats.nl. This site shows their data; the rights remain with the compilers. See the site's disclaimer for the full story.

Contact

Found a mistake, missing a chart, or just want to wave? Use the feedback form or the guestbook — both are linked at the bottom of every page. Enjoy the archive!
